

ENVIRONMENTAL POLICY

Mets is committed to exploring all practical opportunities in business practices to minimize the impact of our operations on the environment.

This is achieved through:

- **Planning management and auditing systems**

Designed to eliminate and prevent inefficiencies that contribute to operational waste and emissions.

- **Exploring new technology and business innovation**

This could represent a change in the resources used in the business, or operational models and procedures. Opportunities are explored in conjunction with our clients, and drive change to enhance our environmental footprint.

Our management is in close contact with leading edge companies in green technology, who assist with trials and implementation of breaking technology.

- **Internal Resource Usage**

Purchasing policies, and administrative practices are managed with the preference for:

- Buying local and Australian made
- Impact on Water Scarcity and Energy Consumption
- Minimising carbon emissions

We will continue to monitor local and international trends in environmental “good practice” and work with our business partners to unlock opportunities. We are aware that our distributional efficiencies directly impact on the corporate goals of our clients.

It is our responsibility to minimize our environmental impacts and therefore enhance our mutual objectives for environmental responsibility and, where applicable, carbon neutrality.

January, 2010.
